About the Placement:

Detailed Placement Description

our farm is different, we raise multiple breeds of heritage pork. our main customers are homesteaders in which people want the best of the best without antibiotics, steroids or gmo feeds. our main breed of pigs are the mangalitsa's in which every part of the pig is used. it is known as the kobe of pork with red meat. the fat is rendered and used to make the flakiest pasteries. sales of piglets average about \$800 a piglet for breeding stock. we have also taken the line of meishan pigs. the are a rare pig from china which was studied in the us for the last 20 years by iowa university and the usda. this breed has just recently been made available to the general public for breeding. this breed of pig is very unique as is has litters of 16 piglets and it can sexually mature at 90 days of age. learning about the breed would be a great benefit for an intern coming from a country that has difficulties feeding it's population. our farm practices are sustainable and all natural without the use of antibiotics or steroids. we also pride ourselves on the ability to repurpose items that would be going to the landfill and build a future us for items as such.
